

Bindows™

The professional development platform for Barracuda AJAX applications

Bindows is the leading Barracuda Embedded Web Server programming framework for developing rich device control AJAX and Web 2.0 applications, and is the *only* framework for web applications that delivers a true “look and feel” of Windows applications.

What is Bindows?

- Bindows is a platform for developing, zero-footprint applications, with rich GUI that fully supports AJAX and Web 2.0 concepts
- Bindows applications can be used by over 90% of Web users, without having to install any software
- Bindows communicates with the device in real time by using the EventHandler Barracuda plugin
- Bindows performs most of the processing on the client, very little processing on the server
- Agnostic to operating systems
- Runs on major browsers
- Infinitely (almost) scalable
- Built for extension (search, sound, voice, video, maps, etc.)

Time to Market

Bindows enables quick development of rich and powerful AJAX applications by providing:

- The richest windowing software development kit for the web
- Object-oriented, integrated design environment enabling developers to leverage existing programming skills and proven methodologies VS. unsystematic and error-prone web design practices and procedures
- Full integration with the Barracuda Embedded Web Server by using the EventHandler or Web-Services.
- Complete support for localization (languages, date, time, currency formats, etc.)

Bindows is typically stored on the device in a ZIP file. The Barracuda ZIP reader plugin delivers the framework as compressed data to the browser client.
