

Key New Features:

- Distributed-Database Support

Key Benefits:

- Reliability
- Performance
- Efficiency
- Innovation
- Flexibility
- Excellent Support

Partners:

Raima Database Manager (RDM) Embedded Distributed extension provides additional reliability to our time tested and dependable RDM database engine. In this Distributed Database solution we have added functionality that will enable embedded system to develop complex distributed applications.

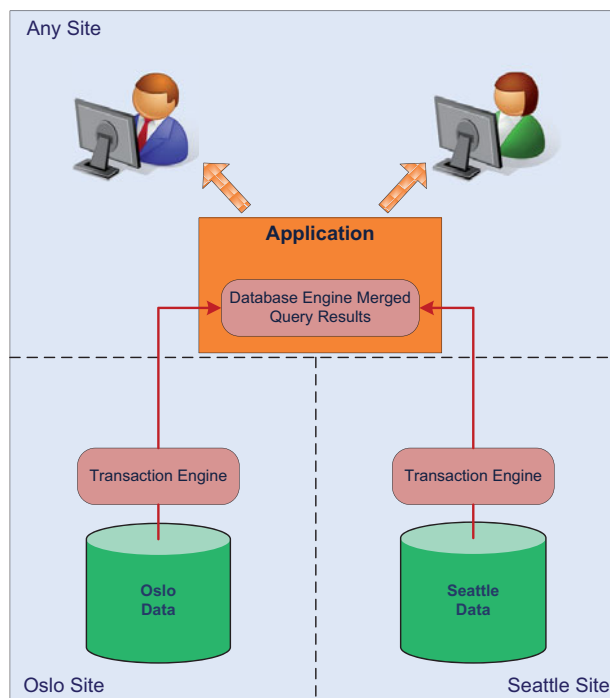

Overview:

Unique to RDM_e Distributed is the ability to access data distributed across multiple embedded systems mounted on a back plane or across geographical continents. Distributed data solves the problem of data fan-out or data clustering which is typically found in enterprise systems such as the Google Search Engine, or Expedia's Flight Booking System. Within all markets, but especially in the Telecom market, requirements for enterprise features like distributed data has become increasingly important to embedded system developers. The RDM_e Distributed solution provides distributed database capabilities to the embedded systems market.

Key Functionality:

Distributed Database Support

View multiple databases as a single table! RDM Embedded's distributed database support allows any application to connect to one or more databases and query them as if it was a single instance. Use this technology to do global queries, locally or across a network, to multiple databases instances without caring where the data is located. In addition, the technology can be used to achieve true horizontal scaling across clustered or distributed systems.

Requirements:

- RDM Embedded Core

Operating Systems Supported:

- AIX
- Embedded Linux
- FreeBSD
- Integrity
- HP-UX
- Linux
- MacOS
- QNX Neutrino
- Solaris
- VxWorks
- Windows
- Windows CE
- Windows Embedded
- *Others Upon Request*
